

Welcome to the PlanEATary Quest

Promoting planetary health, one bite at a time!

Question 1

Sourcing sustainable food

Pages 2 - 5

Question 5

Eating diverse plant foods

Pages 16 - 18

Question 9

Diverting food waste from landfill

Pages 31 - 33

Question 3

Connecting with local food system

Pages 10 - 12

Question 7

Eating minimally processed food

Pages 23 - 26

Question 11

Minimising food packaging

Pages 39 - 42

Question 2

Familiarity with Native Ingredients

Pages 6-9

Question 6

Eating meat less frequently

Pages 19 - 22

Question 10

Recycling food packaging

Pages 34 - 38

Question 4

Eating foods while they're in-season

Pages 13- 15

Question 8

Reducing avoidable food waste

Pages 27 - 30

Question 12

Promoting breastfeeding

Pages 43 - 47

Question 1

When you source or purchase your food, how often do you think about the way it has been produced, grown or raised and whether it is environmentally sustainable?

1 - Never, 2 - Rarely, 3 - Sometimes, 4 - Often, 5 - Always

Why is this important?

Many current food production methods are **unsustainable** [1,2]. Therefore **changes to the food system** to support planetary health are required [2,3].

Goal 12 of the United Nations Sustainable Development Goals (SDGs) - is to ensure **sustainable consumption and production** patterns.

All foods have an environmental impact. Ideally, we would **enhance the nutritional value, and social and economic benefits** we receive in return for the environmental costs of production, as well as produce all foods in a more sustainable way.

The environmental impact of food production systems is complex and can be assessed using a variety of indicators. **Eating locally produced food is often better**, e.g. Australian-caught seafood which rates well on sustainability measures,[4] and **transport emissions** can be reduced. However **local doesn't always mean sustainable**[5].

Animal foods often have a higher environmental impact, however they also help meet nutrition targets and improve public health.[6] Choosing **diverse protein sources, emerging protein-rich alternatives**, and more sustainably produced options, can reduce the overall impact of the diet.

'Ethical eating' refers to the consideration of the economic, social and environmental aspects of purchasing or consuming foods and beverages, including animal welfare, social justice and environmental stewardship[7]. The concept of ethical eating fits well within a **holistic, planetary health mindset**.

Being an engaged and informed food citizen, and demanding better can be a force for change. The **food citizenship movement** brings people together to empower them as citizens, not consumers. Food citizenship is the antidote to passive consumption, allowing people to take ownership of their food environment and make their communities thrive - including the people, animals and planet [8].

Question 1

When you source or purchase your food, how often do you think about the way it has been produced, grown or raised and whether it is environmentally sustainable?

1 - Never, 2 - Rarely, 3 - Sometimes, 4 - Often, 5 - Always

How can I improve my score?

Select from these tasks - and don't forget to share your quest for planetary health on socials with #PlanETaryQuest!

Read the [Food Citizenship manifesto](#). What is one action you could take to practice food citizenship? Share this to social media using the hashtags #foodcitizen #PlanETaryQuest

Read the CSIRO webpage on [Reducing the environmental impact of your diet](#). What is one achievable change you could make to reduce the impact of your diet?

Visit the website [Shop Ethical](#). Look up a core food category (e.g. cereals or dairy) and identify a product and brand that rates well. Consider switching to this brand and share your experience on social media using the hashtags #ethicalfood #PlanETaryQuest

Review [Meat, metrics and mindsets: exploring the debates on the role of livestock and alternatives in diets and farming](#) by Sustainable Table. How would you summarise this article in one sentence?

Do some **research** to find producers that promote environmental sustainability and animal welfare.

- o Beef [Sustainable Table Guide](#).
- o Pork [Sustainable Table Guide](#)
- o Eggs [Sustainable Table Guide](#)
- o Dairy [Sustainable Table Guide](#)
- o Seafood [SAFS app](#) (Status of Australia Fish Stocks) or [Sustainable Seafood Guide](#)

Choose one animal-derived food that you eat regularly (eg. beef, pork, poultry, fish, seafood, eggs) and **reflect on**:

- The various indicators/measures of environmental impact;
- Where you purchase this from, and;
- How much you know about the way in which it's been produced.

Find out about [regenerative agriculture](#) and search for a local beef supplier using these practices. How does your current meat supplier rate compared to this supplier? Would you consider switching? Why, or why not?

Question 1

When you source or purchase your food, how often do you think about the way it has been produced, grown or raised and whether it is environmentally sustainable?

1 - Never, 2 - Rarely, 3 - Sometimes, 4 - Often, 5 - Always

How can I improve my score?

Select from these tasks - and don't forget to share your quest for planetary health on socials with #PlanEATaryQuest!

Dietitian Connection has some great resources. **Take the time to watch some of their webinars including [Consumer behaviour, diet and sustainability: how are they connected?](#)** Answer the questions: what is one new thing you learned? What implications does it have for your area of dietetic practice (or if you are student, the area of practice that most interests you)? **[Unlocking sustainable eating. How can dietitians empower their clients to eat more sustainably? is another informative webinar.](#)** After watching, answer the question: What are two things presented that the public might find surprising?

For Dietitians Australia members:
Do a self-assessment and create CPD goals and tasks as part of your annual CPD plan:
<https://icdasustainability.org/learning-modules/sustainability-self-assessment/>

For Dietitians Australia members:
View the DA Food & Environment Interest Group webinars, [Measuring the environmental impact of food](#), and [Assessing the environmental impact of food](#) via the Centre For Advanced learning. Answer the question: *what would be your 1-minute-lift-conversation about the environmental impact of food?* Record yourself on video. Seek feedback about it from a colleague or friend to determine if you communicated clearly and convincingly. Upload to social media if you wish using the hashtag #PlanEATaryQuest

WEBINAR

Read the published paper, [Diets within Environmental limits: the climate impact of current and recommended Australian diets](#). What are at least 3 key messages you take from it? Answer the following questions: which two foods are climate neutral in Australia and why? What are two other non-climate indicators of environmental impact?

Question 1

When you source or purchase your food, how often do you think about the way it has been produced, grown or raised and whether it is environmentally sustainable?

1 - Never, 2 - Rarely, 3 - Sometimes, 4 - Often, 5 - Always

Question 2

How familiar are you with the history, unique nutritional properties, flavours and culinary use of Australian native ingredients?

1 - Very unfamiliar, 2 - Unfamiliar, 3 - Somewhat familiar, 4 - Familiar, 5 - Very familiar

Why is this important?

For thousands of years, **Indigenous Peoples' food systems** have achieved ecological balance through **resilient and sustainable food practices**. (1) Central to these ancient practices is a deep respect for land, waters, animals and plants. (1) We can benefit greatly from knowing more about our country's traditional native foods.

Including more native ingredients and foods into our diets may help to reduce intake of less nutritious, highly processed foods, (2) and purchasing native foods and ingredients from Indigenous-owned enterprises helps promote economic empowerment. Learning about the seasonality, nutritional properties and flavours of locally cultivated and wild food species can improve food security and enjoyment of meals.

Native foods are better adapted to local climate and soil conditions compared to non-traditional varieties.(1) Along with the **environmental benefits of cultivation** including Indigenous land management practices, native foods can also be higher in micronutrients and may provide **health benefits**.(1) In fact, many Indigenous Peoples' foods are also considered to have medicinal properties. (1)

The accelerated rate of environmental changes including rising sea levels resulting from the climate crisis is predicted to impact the native food industry.(3) Fortunately, practices such as '**reading the Country**' are being used to adapt to these changes.(3) **Maintaining land for biodiversity preservation** is one way of increasing productivity in native food agriculture.(3) In many countries Indigenous Peoples are taking action to assess and respond to climate change. (3,4) Such knowledge will be key to transforming dominant food systems and making them more sustainable.(3,4)

Question 2

How familiar are you with the history, unique nutritional properties, flavours and culinary use of Australian native ingredients?

1 - Very unfamiliar, 2 - Unfamiliar, 3 - Somewhat familiar, 4 - Familiar, 5 - Very familiar

How can I improve my score?

Select from these tasks - and don't forget to share your quest for planetary health on socials with #PlanEATaryQuest!

Research examples of food companies that are Indigenous-owned and take action to **promote** (eg. share on your socials, purchase some products from them, etc). **Research your favourite food product that uses native ingredients** to see who benefits financially from product sales (eg. is the business Indigenous-owned?). [Seasoned Traveller](#) (5)

Watch SBS Food's '12 Australian bushfoods you may not know about' (8 mins) to gain some insight into bush foods and how these can be cooked.(9)

Do some **research** to see if there are restaurants, cafes or caterers near you that are **ethically sourcing and serving Australian native ingredients**. Consider whether you could host your next social gathering at, or have a work function catered by, these businesses. [Indigenous Australian-Owned Food & Restaurant Directory - Seasoned Traveller](#) (5)

Familiarise yourself with at least one Australian native ingredient to learn about its history, properties, flavour and culinary use. [Australian Native Food & Botanicals](#) (6).

Incorporate at least one new Australian native ingredient into a meal on your weekly menu.

Question 2

How familiar are you with the history, unique nutritional properties, flavours and culinary use of Australian native ingredients?

1 - Very unfamiliar, 2 - Unfamiliar, 3 - Somewhat familiar, 4 - Familiar, 5 - Very familiar

How can I improve my score?

Select from these tasks - and don't forget to share your quest for planetary health on socials with #PlanEATaryQuest!

'Warndu Mai - Good Food' is a great starting point if you are interested in **trying some native recipes**. This cookbook was created by Damnie Coulthard and Rebecca Sullivan and serves as an excellent, easy-to-follow guide to native flavours and ingredients. (10)

Learn from Tracy Hardy (Accredited Practising Dietitian) by following [@wattleseednutrition](https://www.instagram.com/wattleseednutrition) on Instagram or completing one of her workshops

For food and sustainability, **have a read of articles such as 'How climate change is reshaping Australia's native food industry'** to explore various First Nation perspectives on the impact of climate change on native foods. (12)

Subscribe or take a look at the [National Indigenous Times](https://www.abc.net.au/news/2020-05-15/national-indigenous-times/). (11)

Investigate Bruce Pascoe's <https://www.blackduckfoods.com.au/news> website to explore First Nation's agriculture. (7)

Read Bruce Pascoe's 'Dark Emu' to learn about pre-colonial agriculture and food systems. (8)

Question 2

How familiar are you with the history, unique nutritional properties, flavours and culinary use of Australian native ingredients?

1 - Very unfamiliar, 2 - Unfamiliar, 3 - Somewhat familiar, 4 - Familiar, 5 - Very familiar

Question 3

How often do you source food from your local food system? E.g. Local community markets, edible nature strips, community supported agriculture (farm-to-consumer box schemes), beekeepers, farm gates, your own garden

1 - Never, 2 - Rarely, 3 - Sometimes, 4 - Often, 5 - Always

Why is this important?

In Australia **most people source their food domestically**, with only 11% of food consumption from imported food in 2020.(1) Across the country you will find many different food growing regions that grow a variety of produce for Australian consumption. Exactly what is grown in each region depends on the climate, landscape, water availability and soil types.

locally grown

This ties into **the concept of food citizenship** as explored in Question 1. Knowing more about where our food comes from allows us to make more **informed decisions** about our **food choices** such as sourcing locally (2).

Fresh produce must be labelled with its **Country of Origin (COO)** so it's easy to spot imported fruits and vegetables. COO labelling is also applied to packaged food and identifies whether foods were grown, produced, made or packaged in Australia or overseas (3). The **kangaroo symbol and accompanying visual percentage gauge** make this information stand out on a product label.

Promoting local food consumption has a number of **benefits** including:

- i) reducing the distance required for food transport;
- ii) urging consumers to become familiar with food seasonality and availability depending on different climates;
- iii) putting greater value on our food by connecting with the individuals involved in producing, growing and/or raising our food.

Reducing food miles through **purchasing local produce** **minimises fossil fuels** used in this phase of the food system. Not only can we minimise our carbon footprint, but making conscious decisions to purchase locally sourced foods from local community markets, edible nature strips and community supported beekeepers and/or farm gates allows us to build more of a connection to our local food system, the people in it, and our natural ecosystem (4).

Question 3

How often do you source food from your local food system? E.g. Local community markets, edible nature strips, community supported agriculture (farm-to-consumer box schemes), beekeepers, farm gates, your own garden

1 - Never, 2 - Rarely, 3 - Sometimes, 4 - Often, 5 - Always

How can I improve my score?

If you scored never, rarely or sometimes for this question, please try these tasks as part of your PlanEATary Quest. Share your experiences using the Twitter hashtag **#planEATary**

Try sourcing your honey locally. Using the 'Save the bees' website, navigate to the 'Honey Map' tab to assist with finding a local gem.

www.beethecure.com.au (4)

Create an edible nature strip by converting the existing grassy area next to the footpath into a space abundant with a variety of edible plants.

Check the country-of-origin of fresh produce and avoid imported produce.

Investigate your local farmers market. To find your local market go to www.farmersmarkets.org.au (5) When you are there, try to interact with the local producers to learn more about the products. This may change/challenge the way you think about your food when you next go grocery shopping.

- **Visit your local council's website** to find a list of community gardens and community food swaps within your area. There are several ways you could get involved.
 - Volunteering - help with gardening tasks
 - Join workshops - participate in workshops offered by the community garden to learn about gardening techniques, composting and worm farming,
 - Gardening plots - Rent a garden plot to cultivate your own plants and contribute to the overall garden
 - Connect with others - Interact with fellow gardeners, volunteers and organizers to build relationships and exchange knowledge

Research a uniquely local food to your area or Australian state and learn about/become familiar with what is grown in your area. This may be an introduced food or a wild ingredient (mushrooms, Warrigal greens, native mint, lemon myrtle, finger limes, Davidson plum etc).

Question 3

How often do you source food from your local food system? E.g. Local community markets, edible nature strips, community supported agriculture (farm-to-consumer box schemes), beekeepers, farm gates, your own garden

1 - never, 2 - rarely, 3 - sometimes, 4- often, 5 - always

Question 4

How often do you consider what is in-season when you make choices about purchasing fruit and vegetables?

1- Never, 2 - Rarely, 3 - Sometimes, 4 - Often, 5 - Always

Why is this important?

Purchasing fresh produce that is 'in-season' not only tends to be more **cost-effective**, but also fosters a **deeper connection with nature** and a **more conscious approach** to our food choices. Eating in-season involves selecting foods that are **naturally abundant** and at their **peak availability** for the specific time of the year.(1) This practice aligns with changing seasons and resonates with traditional cycles of nature.

By embracing in-season eating, we not only make more sustainable choices but also **reconnect with nature's rhythms** and become **more attuned to the changes in seasons**. This practice underscores the significance of being mindful about the foods we consume and the positive impact it has on both our health and the environment.

To further deepen your connection to the source of your food, explore purchasing directly from **local producers** such as at the farmers' markets.(6) This approach further reduces 'food mile's, as farmers bring their fresh harvest straight from the farm to the point of sale. For an even more sustainable approach, consider **cultivating your own produce** in your backyard, thereby eliminating 'food miles' entirely.

The seasonality of food varies depending on geographical location and climate, as foods are better grown in some conditions than others. Whilst it is generally true that foods grown locally and in-season often require **shorter distances to travel** (fewer 'food miles') before reaching the supermarket shelves, 'food miles' is only one factor contributing to a food's environmental impact.(2,3)

Foods grown in distant locations might still have a lower environmental impact due to **efficient agricultural practices and transportation**.(4,5) Additionally, choosing foods that are in-season provides an opportunity to truly savour the **flavours and nutrients** that develop naturally during their growth cycle. This approach contributes to the deliciousness and nutritional quality of fresh food. For instance, during winter in Australia, mangoes are not locally harvested, so fresh mangoes are imported and have traveled a long way and cost more. Whereas in the mango season from September to March, you can enjoy tasty and flavoursome mangos rich in Vitamin C, grown in the Northern Territory and Queensland, at a **lower cost**.

Question 4

How often do you consider what is in-season when you make choices about purchasing fruit and vegetables?

1- Never, 2 - Rarely, 3 - Sometimes, 4 - Often, 5 - Always

How can I improve my score?

If you scored never, rarely or sometimes for this question, please try these tasks as part of your PlanEATary Quest.

Browse seasonal food guides and consider keeping a copy handy either on your fridge or phone to help plan meals and shopping lists. See a few of our favourites below:

- <https://www.sustainabletable.org.au/journal/seasonal-produce-guide> (Australia) (7)
- <http://seasonalfoodguide.com/> (by state) (8)

Find a community garden in your area to grow local, seasonal produce with others. <https://communitygarden.org.au/> (9)

Explore your local farmer's markets. You will likely discover a variety of fruits, vegetables, and other produce that you might not find in a regular supermarket.

Find some great recipes using seasonal fruit and vegetables (Sum/Aut/Winter/Spr). Try searching online for recipes using the seasonal ingredient, for example search "eggplant recipes" or "pear recipes"

Develop your green-thumb and plant some veggies, herbs or fruit trees (in a garden or in pots), considering what grows well in your area. Share a photo of any home-grown goodies on your socials, using the hashtags #homegrown #kitchengarden #planeataryquest

When preparing your shopping list, rather than listing specific fresh items, **allow some flexibility to purchase in-season items by colour or group** (eg. "greens", "hand fruit", "orange-veg" etc).

Question 4

How often do you consider what is in-season when you make choices about purchasing fruit and vegetables?

1 - Never, 2 - Rarely, 3 - Sometimes, 4 - Often, 5 - Always

Question 5

On average, how often would you eat more than 30 different plant foods, in a week?

1- Never, 2 - Rarely, 3 - Sometimes, 4 - Often, 5 - Always

Why is this important?

Plant-based eating involves primarily eating food sources from plants including wholegrains, seeds, nuts, legumes, beans, herbs, spices, fruits and vegetables (1).

Research indicates that transitioning to a **plant-based style of eating** (such as the Mediterranean diet, flexitarianism or vegetarianism) can **dramatically lower** carbon emissions and overall environmental impact (2,3). This is mainly due to the fact that the production of animal-based food products like meat, poultry and dairy contribute to higher levels of greenhouse gas emissions and greater use of vital resources such as water and land (4).

Plant-based eating can also contribute to **biodiversity preservation**. Biodiversity includes all living organisms that play a role in supporting planetary processes ranging from microbes to larger living species like mammals and humans. Current food-systems, characterised by intensification of agricultural practices have been linked to the rapid loss of biodiversity through activities like over-farming and habitat destruction (5). Embracing a diverse plant-based plant-based style of eating could promote biodiversity conservation.

In addition to benefiting the environment, plant-based eating can also **enhance human health**. When plant-based diets are well-planned they typically have **lower levels of saturated fat** and contain **protective components** such as fibre, vitamins, minerals, phytosterols and antioxidants in abundance (3). Increasing the proportion of plant-based foods in your diet has been linked to various **physical healthy** benefits and **positive effects on mental health**. (6)

While many of us are familiar with the recommendations of consuming '2 fruit & 5 vegetables' daily, another approach to improving your diet is by aiming to include **30 or more different plant foods each week**. This practice can contribute to **better gut health** (7) and encourage you to explore new foods in different combinations while eating more plants.

Question 5

On average, how often would you eat more than 30 different plant foods, in a week?

1- Never, 2 - Rarely, 3 - Sometimes, 4 - Often, 5 - Always

How can I improve my score?

If you scored never, rarely or sometimes for this question, please circle any of these tasks that you consider possible to try as part of the PlanEATary Quest.

Create a list of the plant foods you eat across a week. What category could you try and get a few more plants from? See this [plant food tracker](#) from Dietitian Connection for inspiration (8).

Choose a favourite meal and substitute one of the animal-based ingredients (e.g. meat) for something plant-based. For example using lentils instead of mince in pasta sauce, or tofu instead of chicken in a stir-fry.

Once a week, swap out a common plant food for something new or different. For example, switch pasta for quinoa, rice for barley, oats for chia seeds, or potato for sweet potato.

Nuts are a common forgotten plant food but are nutritional powerhouses. **Add a serving of nuts each day** such as a handful in the afternoon, added to breakfast cereal, crushed on a salad, in a nut-based spread on toast or added to smoothies.

Is a plant-based diet the only solution to reducing our dietary eco-footprint? **Read this [Australian research](#)** and suggest other effective ways to achieve this goal (9).

Share and promote plant-based recipes among your friends, work colleagues and in your community.

- Have a vegetarian dinner party
- Take a vegetarian dish to a 'bring-a-plate' gatherings
- Create Meatless Monday at work
- Share recipes and photos of your vegetarian meals on social media using the hashtag #plantbased

Once a week or whenever possible, purchase an unfamiliar 'wildcard' plant-food to create a meal with. Make sure it is in-season and try to source it from somewhere other than the supermarket (farmers market, local producer, community garden).

Question 5

On average, how often would you eat more than 30 different plant foods, in a week?

1- Never, 2 - Rarely, 3 - Sometimes, 4 - Often, 5 - Always

Question 6

How often do you eat main meals that are meat-free? (i.e. meals without beef, chicken and other poultry, pork, lamb)?

1 - less than once a week, 2 - once a week, 3 - two to four times a week, 4 - five to six times a week, 5 - always

Why is this important?

The assessment of the environmental impact of meat production is complex, and varies by meat type. The **Australian beef and sheep industries** currently contribute around **10% of Australia's total greenhouse gas (GHG) emissions** and over **two-thirds** of this comes from **cattle**. Meat and Livestock Australia (MLA) has plans to be carbon neutral by 2030, (1) however **global meat production represents an environmental burden.**(2)

Australia's meat consumption is high compared to other countries (apparent, not actual consumption) - see figure 1 below.(3)

FIGURE 1. Per person apparent consumption of meat, selected countries, 2018 (OECD data)

If Australians made these changes to **consume 'just enough' meat** to meet individual nutritional needs and increased the variety of other protein sources, we could **achieve both health and environmental benefits.**

According to the **2013 Australian Dietary Guidelines**,⁽⁶⁾ current recommendations for consumption of meat (and seafood) are:

- **No more than 455g cooked red meat** (beef, lamb/mutton, pork) per week; 65g cooked (=90g raw) per day (e.g 3-4 times per week).
- Include **2 serves fish/seafood per week**. A serve is 100g cooked OR 115g raw.
- No quantitative advice is given for poultry in the Guidelines, however for meal planning purposes **2 serves poultry per week** fits within recommendations for this food group. A serve of poultry is 80g cooked OR 100g raw.

It is estimated Australians consume 57g of unprocessed red meat (beef, sheepmeat and pork) per day per capita, which is less than the recommended 65g/day in the Australian Dietary Guidelines. This varies by gender with men consuming more.(4)

Comparing estimated consumption to recommended intakes in the broader meat and alternatives food group, the 2013 Australian Dietary Guidelines found omnivorous adults would need to eat 40% more poultry, fish, seafood, eggs, tofu, nuts and seeds to meet recommended intakes. Men would also need to consume around 20% less red meat.(5)

Question 6

How often do you eat main meals that are meat-free? (i.e. meals without beef, chicken and other poultry, pork, lamb)?

1 - less than once a week, 2 - once a week, 3 - two to four times a week, 4 - five to six times a week, 5 - always

How can I improve my score?

If you scored 1 or 2 points (eat meat-free meals once a fortnight or less), you could improve your score by trying the following tasks. Share your experience on social media channels with hashtag #PlanEATary.

To begin your journey **read** the FAO report: [Contribution of terrestrial animal source food to healthy diets for improved nutrition and health outcomes](#) (7) and compile a list of key messages

Read [this paper](#) about mycoprotein and its potential food security and environmental advantages.(10)

Watch Quorn Foods 'Magic of Mycoprotein' video.(11) **Modify a recipe** you usually cook and make it with a mycoprotein-based product instead. **Share your results** on social media using the hashtags #altproteins #mycoprotein

Choose an **animal- derived protein food** that you eat regularly (eg. beef, lamb, pork, poultry, fish, seafood, eggs) and **reflect** on:

- (i) the various aspects of environmental impact;
- (ii) where you purchase this from, and
- (iii) how much you know about the way in which it's been produced.

Do some **research** to find producers that promote environmental sustainability and animal welfare.

If you would like to try eating less meat and you don't have time to cook from scratch there are many convenient options available. **Choose healthier meat-free, plant-protein and vegan options** (choose products with a higher Health Star Rating).

Read about the [nutritional composition of kangaroo meat](#) (8) and [how to cook it](#). (9) **Prepare a recipe** and **share it to social media** using the hashtags #sustainablefood #Australianfood #nativefood

Question 6

How often do you eat main meals that are meat-free? (i.e. meals without beef, chicken and other poultry, pork, lamb)?

1 - less than once a week, 2 - once a week, 3 - two to four times a week, 4 - five to six times a week, 5 - always

How can I improve my score?

If you scored 1 or 2 points (eat meat-free meals once a fortnight or less), you could improve your score by trying the following tasks. Share your experience on social media channels with hashtag #PlanEATary.

Read a [review of cultivated meat](#) from Food Frontier. **Reflect** on whether you would try it, and the factors influencing your decision.(12)

Read social science about [Generation Z's perspectives on cultured meat](#).(13)

Try **dietitian-approved plant-based recipes** on the Doctors for Nutrition [Recipe](#) web page.(14)

Try a recipe using wild game meats (e.g. kangaroo, rabbit), fish you've caught, 'new-age' foods including cultivated meat, fungi / mycoprotein or insects.

Watch National Geographic's video '[Edible Insects](#)'. Share what you have learnt with a friend or family member, or share your thoughts on social media using the hashtags #edibleinsects #entomophagy.(15)

Question 6

How often do you eat main meals that are meat-free? (i.e. meals without beef, chicken and other poultry, pork, lamb)?

1 - less than once a week, 2 - once a week, 3 - two to four times a week, 4 - five to six times a week, 5 - always

Question 7

What proportion of food consumed in your household is minimally processed, nutritious food? e.g. Seafood, pasta, bread, lentils, dairy, fruit & vegetables (frozen, canned, juiced or fresh), meat and poultry

1 - <10%, 2 - 10 - 40%, 3 - 41 - 60%, 4 - 61 - 80%, 5 - >80%

Why is this important?

Processing can add to the enjoyment, variety, convenience, and/or safety of foods. It can also increase the shelf life of food, and subsequently reduce waste. However, with **higher amounts of processing the environmental impact of a food can increase**, and may also result in the addition of high amounts of ingredients that **pose a risk to health** (1).

Our food supply is diverse and there is no one definitive list of highly processed, nutritionally poor foods.

Discretionary foods, as defined by the Australian Dietary Guidelines (www.eatforhealth.gov.au), also

known as **non-core foods**, typically have a higher amount of processing and/or are nutritionally poor. In

Australia, discretionary foods are one of the two **highest contributors to environmental impacts** across multiple metrics (2).

The NOVA system was developed to categorise foods based on their level of processing and it was from here the term '**ultra-processed foods**' (UPF) was coined (3). The four NOVA categories are described in Figure 1.

NOVA Food classification			
Unprocessed or minimally processed foods	Processed culinary ingredients	Processed foods	Ultra-processed foods
Foods which did not undergo processing or underwent minimal processing techniques, such as fractioning, grinding, pasteurization and others.	These are obtained from minimally processed foods and used to season, cook and create culinary dishes.	These are unprocessed or minimally processed foods or culinary dishes which have been added processed culinary ingredients. They are necessarily industrialized.	These are food products derived from foods or parts of foods, being added cosmetic food additives not used in culinary.
Legumes, vegetables, fruits, starchy roots and tubers, grains, nuts, beef, eggs, chicken, milk	Salt, sugar, vegetable oils, butter and other fats.	Bottled vegetables or meat in salt solution, fruits in syrup or candied, bread, cheeses, purees or pastes.	Breast milk substitutes, infant formulas, cookies, ice cream, shakes, ready-to-eat meals, soft drinks and other sugary drinks, hamburgers, nuggets.

Figure 1: NOVA Food classification (4)

Many UPF (but not all) are also considered to be discretionary foods, however some core foods are also classified as UPF using the NOVA definition.(5) There is debate whether the current NOVA UPF classification is a valid and reliable indicator of nutritionally poor or environmentally adverse foods (6,7,8,9).

Question 7

What proportion of food consumed in your household is minimally processed, nutritious food? e.g. Seafood, pasta, bread, lentils, dairy, fruit & vegetables (frozen, canned, juiced or fresh), meat and poultry

1 - <10%, 2 - 10 - 40%, 3 - 41 - 60%, 4 - 61 - 80%, 5 - >80%

How can I improve my score?

If you scored 3 points or less (<50% minimally processed, nutritious foods) for this question, try some of these tasks as part of your planEATary Quest challenge.

Do a **kitchen stocktake** of your pantry and fridge to **identify** the foods and beverages which are both discretionary foods and/or highly processed or ultra processed foods. Then see what **alternatives** are available that are less processed and more nutritious.

Tips on how to assess:

- Use the Dietary Guidelines to identify [discretionary foods](#), and/or the Health Star Rating (HSR) of below 3.5 stars.
- Give yourself a **free-pass** for processed products that help you prepare balanced, tasty meals, such as flavour bases, spice kits and condiments, which could be classified as Group 2 Foods 'Processed culinary ingredients'
- To estimate the impact of processing, **ask yourself**:
 - How far removed is this food from its original form? Further removed = highly processed.
 - How much nutrition has been lost in its processing? A lot = highly processed.
 - Would it be classified by NOVA as an UPF?

Choose one or more of the highly processed, nutritionally poor foods or takeaway meals you frequently purchase.

- Is there a healthier alternative to this food?
- Could you make it from scratch with minimally processed ingredients?
- Can you come up with a version of a takeaway meal to make at home with healthier ingredients and less packaging? e.g. home-made Mediterranean vegetable pizza instead of frozen pepperoni pizza, or natural yoghurt with honey and nuts instead of a chocolate-coated ice cream on a stick?

Share your recipe on social media, using the hashtag **#HomeMade** or **#BetterThanTakeaway**

Think of a favourite food/beverage you enjoy that is considered highly processed and nutritionally poor, for example an apple pie, block of chocolate or alcoholic beverage. Could you **find it produced locally**, such as from a bakery, chocolatier, or small brewer/distiller? This way you can support your local food system and the people in it.

Share your experience using the hashtag **#LocalFood**

Question 7

What proportion of food consumed in your household is minimally processed, nutritious food? e.g. Seafood, pasta, bread, lentils, dairy, fruit & vegetables (frozen, canned, juiced or fresh), meat and poultry

1 - <10%, 2 - 10 - 40%, 3 - 41 - 60%, 4 - 61 - 80%, 5 - >80%

How can I improve my score?

If you scored 3 points or less (<50% minimally processed, nutritious foods) for this question, try some of these tasks as part of your planEATary Quest challenge.

Download the '**NOVA Open Food Facts**' app to help with understanding its classifications and what makes an 'ultra processed food.' Consider the following questions:

- Can you see any issues with this system?
- How well does this system fit within the [Australian Dietary Guidelines](#)?
- Have you found foods that NOVA would classify as UPF but you think are OK for health and the environment? Why?

When shopping at a supermarket, keep track of how much of your trolley comprises foods from the perimeter (fruit, veg, bakery, deli) compared to the middle aisles. Typically, highly processed, nutritionally poor foods are found closer to the centre. Can you **set yourself a goal** that the majority of items come from the outside aisles and less from the middle?

- Are there exceptions to this 'foods in centre aisles are nutritionally poor', rule?
- What foods do you see in the centre aisles that are minimally processed and nutritious?
- What highly processed, nutritionally poor foods can you spot in the outer 'fresh' aisles

Question 8

When you are at home, how many times per week do you discard foods that would otherwise be considered edible? E.g. meal leftovers, wilted vegetables

1 - < once per week, 2 - Once a week, 3 - 2-3 times/week, 4 - 4-5 times/week, 5 - Daily

Why is this important?

If you consider the example of an overripe banana that is discarded, the flesh of the banana would be considered edible food-waste while the skin is non-edible food waste. See a similar example below for an apple.

Figure from Hoehn et al 2023.

Edible food waste refers to any food you intended to eat but threw away, such as spoiled fruit and veg or food that has gone off. **Non-edible food waste** refers to the parts of food not typically meant for consumption. This might include husks, produce skins and peels, bones from animal meats and eggshells.

One third of the world's food is wasted.(1) **Edible food waste can be avoided**, and doing so not only saves money but reduces our environmental footprint. **Reducing food waste** must occur across the food chain, from producers, distributors, retailers, hospitality, food service and households. As a nation, according to Food Innovation Australia every year:(2)

- We waste 7.6 million tonnes of food across the food chain or 312 kg per person.
- One in five bags of groceries are wasted per household, **worth about \$2000-\$2500**.
- Food waste costs the Australian economy ~\$36.6 billion.
- Wasted food uses 2600 gigalitres of water (five Sydney Harbours worth) and 25 million hectares of land (an area larger than the state of Victoria).

Figure from Karusena & Pearson, 2023.

Question 8

When you are at home, how many times per week do you discard foods that would otherwise be considered edible? E.g. meal leftovers, wilted vegetables

1 - < once per week, 2 - Once a week, 3 - 2-3 times/week, 4 - 4-5 times/week, 5 - Daily

How can I improve my score?

If you scored 3 points or less for this question, please circle any of these tasks that you consider possible to try as part of the PlanEATary Quest.

Plan meals and use a **shopping list** to buy only what you need. Download some helpful apps from this [list](#). (4)

Don't discard leftovers. **Consider** how they could be used, such as freezing for another day or transforming them into a new meal.

Record in a diary what food is wasted in your bin (quantities if possible e.g. 2 slices bread) or complete a **food waste audit** (e.g weighed food waste record) (see tool [here](#)). (5)

Take a good look in your fridge and freezer when making a shopping list to **avoid overbuying**.

Store food according to manufacturers/producers instructions properly to extend the life of your food.

Select recipes wisely to avoid wasting leftover ingredients (think one ingredient, but 2 recipes).

Read about Australia's commitment and roadmap to halving food waste by 2030 here: [Reducing Australia's food waste - DCCEW](#)

Question 8

When you are at home, how many times per week do you discard foods that would otherwise be considered edible? E.g. meal leftovers, wilted vegetables

1 - < once per week, 2 - Once a week, 3 - 2-3 times/week, 4 - 4-5 times/week, 5 - Daily

How can I improve my score?

If you scored 3 points or less for this question, please circle any of these tasks that you consider possible to try as part of the PlanEATary Quest.

Label perishable foods in the fridge with the date and use while it is still safe (you can use masking tape and a black marker). Bring the food to be eaten first to the front of the shelf.

Utilise non-edible food waste creatively and safely in compost, stocks and broths, vinegar, cleaning, mulch or animal feed.

Order 'use it up tape' from OzHarvest for free, and implement it in home freezer, pantry and workplace kitchens. Simply label food or keep a shelf labeled to have a visual reminder of what needs to be used up soon. (7)

Only buy **short date-marked food** on sale if you will eat them, or else they will be wasted.

Educate yourself and others on the difference between '**use-by**' and '**best-before**' dates to reduce unnecessary waste of edible food by viewing and sharing this [video](#). (6)

Question 8

When you are at home, how many times per week do you discard foods that would otherwise be considered edible? E.g. meal leftovers, wilted vegetables

1 - < once per week, 2 - Once a week, 3 - 2-3 times/week, 4 - 4-5 times/week, 5 - Daily

Question 9

How often do you divert food waste from landfill in your household? E.g. Home composting, Food Organics & Garden Organics (FOGO) bin, backyard worm farm

1 - Never, 2 - Rarely, 3 - Sometimes, 4 - Often, 5 - Regularly

Did you know?

Food waste produces **8% of global greenhouse gas emissions** (1). When this food waste enters landfill it generates methane, a potent greenhouse gas. Here in Australia food waste accounts for 3% of our greenhouse gas emissions (1). If food waste was a country it would be the third largest greenhouse gas emitter in the world, after the USA and China (1) (see Figure 1).

Figure 1: Top 20 of greenhouse gas emitting countries [excluding Land use (LU), land-use change (LUC), and forestry (F)] vs Food waste (2)

Environmentally responsible methods of food waste management are those which **recycle nutrients and prevent methane production**. According to the Food Recovery Hierarchy (Figure 2) from top to bottom the best options to **utilise food waste** at home are: feeding humans, feeding animals, industrial uses such as at home biogas and then composting (3). **Composting** breaks down organic waste aerobically into nutrient-rich soil (4). There are some at home options described below:

- Food Organics & Garden Organics (FOGO) bins are provided by some councils for residents to **dispose of and collect waste**. This is used to produce compost. Bokashi bins enable benchtop composting in small spaces like apartments
- **Worm farms** break-down organic waste and produce nutrient-rich compost and liquid (AKA 'worm wee') for nourishing soils and plants
- At home **biogas units** can help produce cooking gas from food waste

Figure 2: Food Recovery Hierarchy (3)

Question 9

How often do you divert food waste from landfill in your household? E.g. Home composting, Food Organics & Garden Organics (FOGO) bin, backyard worm farm

1 - Never, 2 - Rarely, 3 - Sometimes, 4 - Often, 5 - Regularly

How can I improve my score?

If you scored never, rarely or sometimes for this question, please circle any of these tasks that you consider possible to try as part of the PlanEATary Quest challenge.

Learn how to **compost correctly** by attending a composting workshop, look up tutorials on YouTube, buying a guidebook or read this blog [here](#) from the Good Living Team at the South Australian Department for Environment and Water

Lobby your local Council to start the FOGO collection in your area.

Investigate what options there are available in your council or area for food waste such as **composting** or **farm animals** that could consume your food waste. You can check out the [interactive map](#) on the Department of Climate Change, Energy, the Environment and Water site to see if FOGO is available in your council area or download the [sharewaste](#) app and meet neighbours, recycle organics.

Feed animals at home if safe and able to do so.

Aim for **zero edible food waste** into landfill in your house and when eating/drinking out of the house.

Source a **worm farm, compost bin** or **Bokashi bin** for your household and learn how to maintain and benefit from it.

Help **educate others** about responsible food waste management e.g. post a photo of your new management strategy on social media and add a hashtag **#planEATaryquest**

Share leftover food with others by taking food to work or give to neighbours, let them know in advance.

Question 9

How often do you divert food waste from landfill in your household? E.g. Home composting, Food Organics & Garden Organics (FOGO) bin, backyard worm farm

1 - Never, 2 - Rarely, 3 - Sometimes, 4 - Often, 5 - Regularly

Question 10

How often do you recycle or reuse food packaging in your household? E.g. Re-purposing the packaging, recycling bin, 10c refund (Government reimbursement scheme)

1 - Never, 2 - Rarely, 3 - Sometimes, 4 - Often, 5 - Regularly

Why is this important?

Packaging is important to deliver safe food to our homes and communicate product information, however the waste generated after use is an **environmental concern**.

World Wildlife Fund (WWF) Australia reports that over 80% of food packaging cannot go into home recycling bins and ends up elsewhere. (1)

Moreover, Australians generate the most single-use plastics waste in the world per capita (one million tonnes) - the equivalent of 60 kg of waste per person per year (2, 3) and only 14% of these single-use plastics are recycled. When disposed of irresponsibly, packaging pollutes air, water and soil and can harm wildlife.

Plastic breakdown in landfill takes a very long time, their adverse impact persists over time, and they produce a variety of harmful by-products to humans and animals including volatile organic compounds and microplastics in both air and leachate (leaking water containing components of the material through which it has passed). (4)

Microplastics are non-biodegradable and pollute land and waterways, causing both physical and chemical hazards for animals and plants. Furthermore packaging takes a lot of resources to produce, such as aluminium, tin, steel, sand (for glass) and trees for paper and cardboard.

Reducing plastic packaging use, increasing recycling and improving product design all **reduce plastics in landfill and the natural environment**. (5) Increasing the amount of recycled materials in new products reduces the need for new resources, boosts the circular economy and encourages innovation. The National Packaging Targets for industry include making 100% of packaging reusable, recyclable or compostable, and 50% average recycled content within packaging by 2025. (5)

Australian Recycling Label

Question 10

How often do you recycle or reuse food packaging in your household? E.g. Re-purposing the packaging, recycling bin, 10c refund (Government reimbursement scheme)

1 - Never, 2 - Rarely, 3 - Sometimes, 4 - Often, 5 - Regularly

How can I improve my score?

If you scored never, rarely or sometimes for this question, please circle any of these tasks that you consider possible to try as part of the PlanEATary Quest challenge.

Record what food packaging you discard and **investigate if there are other options** available with less packaging (i.e. dried beans vs canned)

Complete the [Pesky Plastics Quiz tool](#) to discover the items you use and **decide what you would like to refuse**. Share what you decide on social media using #planEATary

Look around your house to see what items can be **reused, upcycled or repurposed** in some way for storing food

Avoid purchasing **single serve products**

Shop with your own **reusable bags**

Buy foods in **bulk** or larger quantities to reduce individual packaging

Buy foods with zero or less packaging, or biodegradable or recyclable **packaging** (i.e. glass, cans)

Take your **own reusable containers** and/or bags when buying loose/bulk items (fruit, vegetables, nuts, beans)

Question 10

How often do you recycle or reuse food packaging in your household? E.g. Re-purposing the packaging, recycling bin, 10c refund (Government reimbursement scheme)

1 - Never, 2 - Rarely, 3 - Sometimes, 4 - Often, 5 - Regularly

How can I improve my score?

If you scored never, rarely or sometimes for this question, please circle any of these tasks that you consider possible to try as part of the PlanEATary Quest challenge.

Shop at **farmers markets** as many products are sold without any packaging

Make your **own cloth bags** from unwanted fabric to avoid them going to landfill

Make your own **fizzy soft drinks** using a sparkling water machine and flavoured syrups such as SodaStream.

Subscribe to a **fruit & vegetable box** service to avoid packaging

Make your own food from **scratch to reduce the amount of** packaging waste generated. Perhaps share your recipe online and why you cooked it using #planEATary

Batch cook legumes and grains in large amounts and store in meal-size portions in the freezer using your own containers instead of purchasing cans

Advocate for food businesses to switch to biodegradable/compostable packaging and/or use recyclable **packaging**

Explore **creative re-use of food packaging** yourself, like using jars for food gifts such as pickles or as pencil holders. Take a picture and share it using the hashtag #planEATary

Question 10

How often do you recycle or reuse food packaging in your household? E.g. Re-purposing the packaging, recycling bin, 10c refund (Government reimbursement scheme)

1 - Never, 2 - Rarely, 3 - Sometimes, 4 - Often, 5 - Regularly

How can I improve my score?

If you scored never, rarely or sometimes for this question, please circle any of these tasks that you consider possible to try as part of the PlanEATary Quest challenge.

Avoid plastic wrap - store your leftovers in reusable containers, place a plate over the container or switch to wax wraps

Learn about the **Australasian Recycling Label (ARL)**

Be a good recycler, and '**check it before you chuck it**' using the Australian recycling label

Check out **recycling available in your local Council**

Make money by using **cash-back recycling schemes** like 'Return & Earn' for drinks bottles/cans

Reduce contamination of recycling bins by flattening boxes, emptying food and liquid from containers, and not putting plastic bags into the recycling bin

1 - Never, 2 - Rarely, 3 - Sometimes, 4 - Often, 5 - Regularly

1. World Wildlife Fund Australia 2021, How recyclable are your favourite food products? Blog

Question 11

When you eat away from home, how often do you follow practices to minimise food and packaging waste? E.g. bring your own bottle or reusable coffee cup

1- Never, 2- Rarely, 3 - Sometimes, 4 - Often, 5 - Always

Did you know?

Eating and drinking when out and about is part of modern life but it represents a **higher risk of creating food and packaging waste** in landfill, and in the environment. In 2016/2017 it was estimated that 324 000 tonnes of food waste was generated by hospitality and food services. (1) A greater quantity came from takeaway outlets.

Recycling facilities are not always accessible in places such as shopping centres, retail strips, and workplaces. Food packaging is not always recyclable either. It is estimated that almost 1 billion disposable hot cups end up in landfill in Australia every year. (2) The plastic lining inside many of the cups prevents them being recycled through normal processes. Street litter of fast/convenience food packaging can end up polluting the natural environment. Clean Up Australia's 2022 national Rubbish Report (3) reveals:

- Plastics account for 63% of rubbish removed from parks, schools, bushland, creeks, beaches and roadways - a 17% increase from 2021.
- Single use plastic accounted for 25% of all reported rubbish

Question 11

When you eat away from home, how often do you follow practices to minimise food and packaging waste? E.g. bring your own bottle or reusable coffee cup

1- Never, 2- Rarely, 3 - Sometimes, 4 - Often, 5 - Always

How can I improve my score?

If you scored never, rarely or sometimes for this question, please circle any of these tasks that you consider possible to try as part of the planEATary Quest challenge.

Bring a reusable cup (Choose to Up Cup), water bottle, eating utensils and/or **reusable** straw and encourage others to do so.

Take food and water in your **own containers** from home when going out and about (cheaper and better for you too)

Eat in at a cafe or restaurant rather than purchasing take away.

Find a Responsible Cafe or a cafe which offers '**Swap and go**' or a '**mug library**'

Find out where you can refill your reusable water bottle when you are out and about. Your town, city or state may have a **water refill station** map such as Unity Water. Or advocate for one by writing a letter to your local council. If you find one you may want to share how it can be used online #planEATary

Purchase from vendors who offer **compostable takeaway utensils and containers**.

Question 11

When you eat away from home, how often do you follow practices to minimise food and packaging waste? E.g. bring your own bottle or reusable coffee cup

1 - Never, 2 - Rarely, 3 - Sometimes, 4 - Often, 5 - Always

How can I improve my score?

If you scored never, rarely or sometimes for this question, please circle any of these tasks that you consider possible to try as part of the planEATary Quest challenge.

When out and about, take recyclable items/food waste home if community recycling is not available and you can **recycle/compost responsibly** at home

Take home any **leftovers** (if safe to do so)

When buying take-away take your **own containers**

Wash and re-use or recycle packaging of home delivered/take-away meals, or avoid home delivery altogether.

Do not contaminate recycling bins with packaging which cannot be recycled - check with Recycle Mate. You could download the app on your phone and share it with friends

Advocate for recycling facilities in your workplace and educate others on their proper use

Help to **clean up your local area** to prevent litter entering the natural environment, and encourage others to do the same. For example - 3 for the sea. Take a photo of what you collect and share it on social media using the hashtag #planEATary

Question 11

When you eat away from home, how often do you follow practices to minimise food and packaging waste? E.g. bring your own bottle or reusable coffee cup

1 - Never, 2 - Rarely, 3 - Sometimes, 4 - Often, 5 - Always

Question 12

How would you rate your knowledge and advocacy about breastfeeding and planetary health?

1 - No knowledge, 2 - Minimal knowledge, 3 - Basic knowledge, 4 - Adequate knowledge, 5 - Expert knowledge

Did you know?

Breastfeeding can be viewed as both a **public health and climate justice issue**. In fact, to 'breastfeed infants where possible' is one of the thirteen health and sustainable diet-related practices identified in the [Dietitians Australia position Statement on healthy and sustainable diets](#).⁽¹⁾

What is the link between breastfeeding and the climate? There are **significant carbon emissions** associated with **infant formula production**.⁽²⁾ Other direct environmental impacts include excessive land clearing, water use and methane gas generated by dairy farming.⁽²⁾ The actual manufacturing process also requires large amounts of energy and water in addition to any additional environmental impacts needed for distribution.⁽²⁾ There is also the packaging required, potential for wastage when infants don't finish a bottle, ⁽³⁾ and water and energy needed for cleaning and sterilising infant bottles.⁽²⁾

Breastfeeding uses fewer resources and produces **minimal or zero waste**. The improved health outcomes with higher population breastfeeding rates also reduces the demand placed on healthcare resources. Fortunately, the **WHO UNICEF Global Strategy on Infant and Young Child Feeding** has developed policies and interventions aimed at tackling climate change and population health.^(2,4) A little closer to home, the 2013 **Australian Dietary Guidelines** also promote breastfeeding for its maternal and infant health benefits. As dietitians, we can play a key role in advocating for healthy and sustainable food systems that **support breastfeeding to help protect the health of our planet**.

Question 12

How would you rate your knowledge and advocacy about breastfeeding and planetary health?

1 - No knowledge, 2 - Minimal knowledge, 3 - Basic knowledge, 4 - Adequate knowledge, 5 - Expert knowledge

How can I improve my score?

If you scored no knowledge, minimal knowledge or basic knowledge for this question, please circle any of these tasks that you consider possible to try as part of the PlanEATary Quest.

Read the following UNICEF [page](#) (5) and develop a one page flyer/poster/infographic on the planetary health benefits of breastfeeding suitable for sharing on social media, using the hashtag **#Breastfeeding** and **#breastisbest**

Investigate which local health care facilities are accredited with the [Baby-Friendly Hospital Initiative \(BFHI\)](#) (6)

Find comfortable places to breastfeed away from home at [Baby Care Rooms](#). (9) If you can't find any, lobby for comfortable and safe spaces for breastfeeding in your local community.

Support breastfeeding mothers within your family, friends and community by offering encouragement, support and resources. Checkout the [Australian Breastfeeding Association](#) for information, resources, support and education groups in your local area.(7)

Participate in WHO [World Breastfeeding Week](#) and share campaign messages on social media.(8)

Question 12

How would you rate your knowledge and advocacy about breastfeeding and planetary health?

1 - No knowledge, 2 - Minimal knowledge, 3 - Basic knowledge, 4 - Adequate knowledge, 5 - Expert knowledge

How can I improve my score?

If you scored no knowledge, minimal knowledge or basic knowledge for this question, please circle any of these tasks that you consider possible to try as part of the PlanEATary Quest.

Attend or host breastfeeding events such as support groups or awareness events.

Provide or advocate for a comfortable and safe space for breastfeeding in your workplace.

Infant formula should not be advertised/promoted to the public. **Report** inappropriate promotion of infant formula.(11)

Breastfeeding is **protected by anti-discrimination laws**.⁽¹⁰⁾ **Find out** what employers are expected to do in order to provide a supportive, non-discriminatory workplace for breastfeeding women.

Model ideal behaviour by breastfeeding yourself if you can, or support your partner to breastfeed.

Question 12

How would you rate your knowledge and advocacy about breastfeeding and planetary health?

1 - No knowledge, 2 - Minimal knowledge, 3 - Basic knowledge, 4 - Adequate knowledge, 5 - Expert knowledge

How can I improve my score? - For nutrition professionals

If you scored no knowledge, minimal knowledge or basic knowledge for this question, please circle any of these tasks that you consider possible to try as part of the PlanEATary Quest.

Read [The Conversation article](#) (12) on breastfeeding and **answer** these questions:

1. Who/What do the public health practitioners suggest should play a bigger role in increasing breastfeeding rates?
2. What are the five things the authors suggest require investment to increase breastfeeding rates?
3. What should health professionals keep in mind when promoting breastfeeding to women?

Review the Baby-friendly hospital Initiative Australia ([BFHI](#)) (6) and **answer** the following questions.

1. What are the ten steps to successful breastfeeding?
2. How does a healthcare facility become accredited with BFHI?

Read the [summary of the 'Marketing in Australia of Infant Formulas' \(MAIF\)](#) (11) Manufacturers and Importers' (MAIF) Agreement and **answer** the following questions:

1. Which International Code is the MAIF based on?
2. What are the four aims of the MAIF?
3. Give one example of a complaint made about failure to comply with the MAIF agreement?
4. What is a current issue related to the MAIF that has public health advocates concerned?

Question 12

How would you rate your knowledge and advocacy about breastfeeding and planetary health?

1 - no knowledge, 2 - minimal knowledge, 3 - basic knowledge, 4 - adequate knowledge, 5 - expert knowledge
